

Maximal Ideal:- Let  $R$  be a ring and  $I$  an ideal in  $R$ .  
 Then  $I$  is called a maximal ideal if  $I$  is properly contained in  $R$  and  $I$  is not properly contained in any other ideal of  $R$ .

Quotient ring

Let  $R$  be a ring &  $I$  an ideal in  $R$ . Then the set of all cosets of  $I$  in  $R$  denoted by  $R/I$  is defined as

$$R/I = \{I+a : a \in R\}$$

Let  $I+a, I+b \in R/I$ . If we define the operations of addition & multiplication on  $R/I$  as follows:

$$(I+a) + (I+b) = I+(a+b)$$

$$\& (I+a)(I+b) = I+ab,$$

then  $R/I$  is a ring w.r.t. the operations defined above.  
 This ring is called quotient ring or factor ring.

Q. If  $I$  be an ideal of a commutative ring with unity, then prove that  $R/I$  is an integral domain if and only if  $I$  is prime ideal.

Let  $I$  be an ideal of a commutative ring  $R$  with unity.

We first suppose that  $I$  is a prime ideal. Then we shall prove that  $R/I$  is an integral domain.

We know that  $R/I$  is a ring w.r.t. the operations addition & multiplication defined below:

$$(I+a) + (I+b) = I+(a+b)$$

$$\& (I+a)(I+b) = I+ab \quad \forall I+a, I+b \in R/I$$

Let  $I+a, I+b \in R/I$ . Then  $a, b \in R$ . (6)

$$\begin{aligned} \therefore (I+a)(I+b) &= I+ab \\ &= I+ba \\ &= (I+b)(I+a) \end{aligned}$$

i.e. Commutative law for multiplication holds in  $R/I$ .

$$\begin{aligned} \text{Also, } (I+a)(I+1) &= I+a1 \\ &= I+a \\ &= (I+1)(I+a) \end{aligned}$$

i.e. unity element exists in  $R/I$ .

$$\text{Now } (I+a)(I+b) = I \implies I+ab = I$$

~~i.e.  $ab \in I$~~

$$\implies ab \in I$$

$$\implies a \in I \text{ or } b \in I, \text{ since } I \text{ is prime ideal}$$

$$\implies I+a = I \text{ or } I+b = I$$

i.e.  $R/I$  has no zero divisors & hence  $R/I$  is an integral domain.

Next we suppose that  $R/I$  is an integral domain.

We have to prove that  $I$  is prime ideal.

Since  $R/I$  is an integral domain, therefore  $R/I$  has no zero divisors.

$$\text{i.e. } (I+a)(I+b) = I \implies I+a = I \text{ or } I+b = I$$

$$\text{i.e. } I+ab = I \implies I+a = I \text{ or } I+b = I$$

$$\text{i.e. } ab \in I \implies a \in I \text{ or } b \in I$$

This means that  $I$  is prime ideal.

This completes the proof.
