DEMODULATION OF AMPLITUDE MODULATED SIGNAL

Demodulation : The process of recovering the modulating signal from the modulating carrier wave is called demodulation or detection .

The circuit performs this function is called demodulator or detector .

The block diagram of a detector for AM signal

The signal received by the detector contains the angular frequencies ω_c , $\omega_c + \omega_m$ and $\omega_c - \omega_m$.

In order to separate ω_m i.e., to obtain modulating signal, a simple AM

Signal detector diode
