### Bii) KARNAUGH'S MAP \*

The Karnaugh's map also called Karnaugh Veitch map is a method of simplifying Boolean functions in a systematic mathematical way. Though this method can be used for a function of any number of variables but its use is restricted to the functions of upto 5 variables.

In fact Karnaugh Map is another way of presenting the information given by the truth table. In this map method a group of squares are drawn. All these squares are designated in a particular way. Each square of the map represents a minterm. We shall first consider two variables Karnaugh map and then extend this concept to functions of more than two variables. It basically provides a 'cook-book' approach. It is graphical technique.

MAP - FORMAT: K-map is composed of an arrangement of adjacent cells each representing one particular combination of variables. Since the total no. of combination of  $n$ -variable and their complements is  $2^n$ , the K-map consists of  $2^n$  cells.

for 2 variables — No. of cells = 4

for 3 variables — No. of cells = 8

for 4 variables — " = 16

for 5 variables — " = 32

for 6 variables — " = 64 .

No. of cells = No. of combination of variables.

for each row of truth table, there is one specific cell in K-map.

The variables to the left of
